Roboteering!

Making robots is a fascinating and intriguing hobby. To make a successful robot you must become a modern Renaissance Man or Woman. You need to master mechanics, electronics, and computer programming.

But there is more to it. In the future, if you don't know how to get robots to work for you, you are quite likely to end up working for them!

It's easy to get started. There are many kits available, or you could just get a whole load of Lego Technic and play around with it.

There is help available at all levels, and a million videos on YouTube. Or you could just talk to one of the enthusiasts at the Robot Workshop.
